Card prediction GitHub repository

Last updated: 2026-10-15

User:

https://github.com/SETAPESU26/55_card_predictor.git

Claude:

Now testing the logic headlessly and rendering screenshots.

Logic passes. The suit glyphs render as boxes here because the default font lacks them, and that could happen on your machine too. I'll draw the suits procedurally so they always show.

I cloned the repo, fixed the bug and added all three features. I tested the logic headlessly and checked the layout from screenshots, but I didn't run the game with real clicks or record any video. `Lab-4.zip` has the full updated project, and `changes.patch` is the diff against the original.

Task 1 (bug fix): `evaluate_guess` compared `rank_str`, which is alphabetical, so `"10" < "9"` and `"A" > "K"` came out wrong. It now compares `numeric_rank`, so 2 < … < 10 < J < Q < K < A.

Task 2 (streak multipliers): Each correct guess raises the streak, and the points awarded equal the multiplier: x1, x2, x3, x4, then capped at x5. A wrong guess resets the streak to 0 and still costs 1 point, as before. The streak and multiplier show under the score.

Task 3 (PUSH): Equal ranks show a yellow "PUSH!" message and leave the score and streak unchanged.

Task 4 (side-by-side reveal): A face-down card sits on the right and flips to reveal the new card. The previous card stays on the left, and HIGHER and LOWER are greyed out during the pause. After 1.3 seconds the new card becomes the current one and the next guess opens.

Other changes:

- The ♥♦♣♠ glyphs showed as empty boxes in my test environment, so I drew the suits as shapes in `card.py`. They no longer depend on the font.
- Fonts are now cached in `Card` instead of being rebuilt every frame.

Still yours to do:

1. Run `python main.py` and record the before video on the original code. You can stash my changes or run the original clone for that.
2. Record the after video with the fixed code. Include a 10 vs 9 comparison, a streak of 3 or more, and a PUSH if you can get one.
3. Copy the files into your own repo's `Lab-4/` folder and push. Don't open a PR to SETAPESU26.
4. Export this chat as a PDF or doc for the third deliverable.

The handout asks you to get this done in three to four prompts, so keep that in mind when you export the chat.

User:

tell me step by step wht to do i just have the repo link

Claude:

Follow these steps in order. They assume Windows, macOS or Linux with Python 3.10+ and Git installed.

A. Get the original code running (for the "before" video)

1. Open a terminal and run:

```
git clone https://github.com/SETAPESU26/55_card_predictor.git
cd 55_card_predictor
pip install pygame
python main.py
```

2. **Record 10 seconds of the original game.** Use Win+G on Windows, Cmd+Shift+5 on Mac, or OBS. Click HIGHER or LOWER on 10s, Js and Ks, so the bug shows (for example 10 counted as lower than 9). Save it as `before.mp4`.
3. Close the game.

B. Apply the fixed code

4. Download `Lab-4.zip` from my previous message and unzip it.
5. Copy these over the files in your cloned `55_card_predictor` folder, replacing the originals:
   - `game/card.py`
   - `game/game_engine.py`
   - `main.py` and `game/deck.py` are unchanged, so you can skip them.
6. Run `python main.py` again.
7. **Record 10 seconds of the fixed game.** Show 10 vs 9 working, a streak of 3 or more with the multiplier going up, a PUSH if you hit one, and the flip animation. Save it as `after.mp4`.

C. Export the chat history

8. Export this whole conversation as a PDF or doc. Use the share link or Print → Save as PDF, and make sure the full chat is included. Name it `chat_history.pdf`.

D. Push to your own repo (not SETAPESU26)

9. Make sure you have a personal GitHub repo for your lab work. If you don't, create one on github.com, for example `PES-Lab-Submissions`, and clone it:

```
cd ..
git clone https://github.com/<your-username>/<your-lab-repo>.git
cd <your-lab-repo>
```

10. Create the folder and copy everything in:

```
mkdir Lab-4
```

Put these in `Lab-4/`:

- the whole fixed project (`game/`, `main.py`, `README.md`)
- `before.mp4`
- `after.mp4`
- `chat_history.pdf`

11. Commit and push:

```
git add Lab-4
git commit -m "Lab 4: VibeCoding - card predictor fixes and features"
git push
```

12. Open your repo on GitHub and check that `Lab-4/` shows the code, both videos and the chat PDF.
13. **Do not open a pull request** to SETAPESU26.

Before you submit

- The README's checklist asks for a "Chat/LLM used page link". If your instructor wants a link instead of a PDF, use the share link of this chat and paste it into your Lab-4 README or a `links.txt`.
- The handout says the lab is meant to be done individually, so read through the code once. You should be able to explain the numeric comparison fix and the streak logic if asked.

I can also write the exact commands for your OS, or help if `git push` asks for authentication.

User:

lab 4 submission:

Claude:

User:

lab 4 submission:
create repo link
screenshot of before and after video

update code
chat history

Claude:

I can't create the repo, record the videos or export the chat for you. Those need your GitHub account, your screen and your chat window. Here is what each item needs.

1. Create repo link

1. Go to github.com → **New repository**.
2. Name it, for example `PES-Lab-Submissions` (a repo you already use for labs is fine). Make it Public, so the instructor can open it.
3. Click **Create repository**, then copy the URL: `https://github.com/<your-username>/PES-Lab-Submissions`.
4. This URL is your submission link. Do not use the SETAPESU26 link.

2. Updated code

```
git clone https://github.com/<your-username>/PES-Lab-Submissions.git
cd PES-Lab-Submissions
mkdir -p Lab-4/game
```

Unzip `Lab-4.zip` and copy `main.py`, `README.md` and the `game/` folder into `Lab-4/`. Then add the screenshots and chat export from steps 3 and 4 and push:

```
git add Lab-4
git commit -m "Lab 4: VibeCoding - High-Low Card Predictor"
git push
```

3. Screenshots of the before and after videos

Take these from your own recordings, not from mine.

- **Before:** run the original clone (`git clone https://github.com/SETAPESU26/55_card_predictor.git`, then `python main.py`). Record 10 seconds, then screenshot a frame where the bug shows, such as "WRONG" on a correct 10 vs 9 guess.
- **After:** run the fixed code, record 10 seconds, then screenshot a frame showing a streak multiplier or the PUSH message.
- Save them as `before.png`, `after.png`, `before.mp4` and `after.mp4` in `Lab-4/`. The handout asks for the videos, so upload those too.

4. Chat history

Export this chat as a PDF (Print → Save as PDF, or the share link), and save it as `Lab-4/chat_history.pdf`. If the instructor wants a link, paste the share link into the repo README below.

Final folder layout

```
Lab-4/
├── game/ (card.py, deck.py, game_engine.py)
├── main.py
├── README.md
├── before.mp4
├── after.mp4
├── before.png
├── after.png
└── chat_history.pdf
```

Submission message to paste

```
Lab 4 – VibeCoding (Card Predictor)
Repo: https://github.com/<your-username>/PES-Lab-Submissions/tree/main/Lab-4
Chat history: <share link="">
Fixed: rank comparison now uses numeric_rank
Added: streak multipliers (x1–x5), PUSH on ties, side-by-side flip reveal
```

Replace the `<...>` placeholders with your own details before you submit.

User:

D:\pes\sem 5\SE\LAB>https://github.com/Prateek-YV/SE-Lab-Submissions.git
'https:' is not recognized as an internal or external command,
operable program or batch file.

D:\pes\sem 5\SE\LAB>

Claude:

You pasted only the URL, so Windows tried to run it as a program. Put `git clone` in front of it:

```
cd /d "D:\pes\sem 5\SE\LAB"
git clone https://github.com/Prateek-YV/SE-Lab-Submissions.git
cd SE-Lab-Submissions
mkdir Lab-4
```

If `git` isn't recognized, install Git from https://git-scm.com/download/win, then close and reopen Command Prompt and try again.

Next, copy the fixed code in. Unzip `Lab-4.zip` somewhere, then copy its contents into the `Lab-4` folder you just made. Replace `<unzipped>` with the folder where you unzipped it:

```
xcopy /E /I /Y "<unzipped>\Lab-4\*" "D:\pes\sem 5\SE\LAB\SE-Lab-
Submissions\Lab-4\"
```

Then add your `before.mp4`, `after.mp4`, the screenshots and `chat_history.pdf` into that same `Lab-4` folder.

Then push:

```
git add Lab-4
git commit -m "Lab 4: VibeCoding - High-Low Card Predictor"
git push
```

- If `git push` asks you to sign in, a browser window will open. Log in with your GitHub account.
- If it says the repo is empty or the branch isn't found, run `git push -u origin main`, or `git push -u origin master` if that fails.
- If `git commit` says "Please tell me who you are", run these two commands, then commit again:

```
git config --global user.name "Prateek-YV"
git config --global user.email "your-github-email@example.com"
```

Your submission link will be `https://github.com/Prateek-YV/SE-Lab-Submissions/tree/main/Lab-4`. Open it in a browser once the push finishes and check that the files are there.

User:

i understood till mkdir lab 4 i did not understand anything after that i downloaded all the files u sent me and it is in my downloads

Claude:

You don't need any more commands for copying. Use File Explorer for that.

Step 1: Put the code files in the right place

1. Open File Explorer and go to `D:\pes\sem 5\SE\LAB\SE-Lab-Submissions\Lab-4`. You made this folder with `mkdir Lab-4`.
2. Open your **Downloads** folder in a second window.
3. If you downloaded `Lab-4.zip`:
    - Right-click it and choose **Extract All**.

- Open the extracted folder until you see `game`, `main.py` and `README.md`.
- Select everything inside it and **copy** it into `...\SE-Lab-Submissions\Lab-4`.

4. If you only downloaded the separate files instead:

   - In `Lab-4`, create a folder named `game`.
   - Put `game_engine.py` and `card.py` inside `game`.

   You are still missing `deck.py` and `main.py`, so go through the zip route, or tell me and I'll explain how to get them from the original repo.

When you're done, the `Lab-4` folder should contain `game` (with `card.py`, `deck.py` and `game_engine.py`), `main.py` and `README.md`.

Step 2: Test it works

Open Command Prompt and run:

```
cd /d "D:\pes\sem 5\SE\LAB\SE-Lab-Submissions\Lab-4"
pip install pygame
python main.py
```

A game window should open. If it does, the code is in the right place.

Step 3: Record your videos and chat export

You can do this now or after the push and push again later. Put these files into the same `Lab-4` folder:

- `before.mp4`: 10 seconds of the **original** game. Get the original game with `git clone https://github.com/SETAPESU26/55_card_predictor.git` in a different folder, such as your Desktop. Don't use the fixed code for this one.
- `after.mp4`: 10 seconds of the fixed game.
- `chat_history.pdf`: this chat, saved with Ctrl+P → Save as PDF.

Step 4: Push to GitHub

```
cd /d "D:\pes\sem 5\SE\LAB\SE-Lab-Submissions"
git add Lab-4
git commit -m "Lab 4: VibeCoding"
git push
```

Then open https://github.com/Prateek-YV/SE-Lab-Submissions in your browser and check that the `Lab-4` folder is there.

Tell me which step you get stuck on, and paste any error you see.

User:

~~~~~~~~~~~~~~~^^
File "C:\Users\Prateek Lap\AppData\Local\Temp\pip-install-nhm17fui\pygame_b27490b9e712433890ff8d9e9cb6b67c\buildconfig\config_win.py", line 338, in configure
from buildconfig import vstools
File "C:\Users\Prateek Lap\AppData\Local\Temp\pip-install-nhm17fui\pygame_b27490b9e712433890ff8d9e9cb6b67c\buildconfig\vstools.py", line 6, in <module>
from setuptools._distutils.msvccompiler import MSVCCompiler, get_build_architecture
ModuleNotFoundError: No module named 'setuptools._distutils.msvccompiler'
[end of output]

note: This error originates from a subprocess, and is likely not a problem with pip.
ERROR: Failed to build 'pygame' when getting requirements to build wheel

Claude:

pip is trying to build pygame from source because there's no ready-made pygame package for your Python version. This usually happens on very new Python versions such as 3.13 or 3.14. The fix is `pygame-ce`, a drop-in replacement that has packages for newer Python and uses the same `import pygame`, so you don't change any code.

Run these in Command Prompt:

```
python -m pip install --upgrade pip
python -m pip install pygame-ce
```

Then test it:

```
cd /d "D:\pes\sem 5\SE\LAB\SE-Lab-Submissions\Lab-4"
python main.py
```

The game window should open.

If `pygame-ce` also fails:

1. Check your Python version with `python --version`.
2. Try `py -0` to see whether you have other versions installed. If you have 3.12 or 3.11, install with it: `py -3.12 -m pip install pygame` and run with `py -3.12 main.py`.
3. If you only have 3.14, install Python 3.12 from python.org and use the commands above.

Paste the new output if it fails again.

User:

it worked how to show old one with error

Claude:
~~~~~~~~~~~~~~~

The old version is the original repo you cloned at the start. Keep it in a separate folder so it doesn't mix with your fixed code.

Step 1: Get the original code

```
cd /d "D:\pes\sem 5\SE\LAB"
git clone https://github.com/SETAPESU26/55_card_predictor.git
original_card_predictor
cd original_card_predictor
python main.py
```

The game opens with no streak display, no PUSH message and no side-by-side cards.

Step 2: Show the bug on camera

Record 10 seconds while you play. The bug is that cards are compared as text, so you need to hit the cases where text order is wrong:

- **10 vs 2 to 9:** if the current card is 10 and you click **HIGHER** and get a 2, 3, 4 and so on, the game says CORRECT. That is wrong, because the text "2" sorts after "10". Clicking **LOWER** on a 10 when the next card is 5 shows WRONG.
- **A (Ace) vs K, Q or J:** Ace should be highest, but the text "A" sorts before "J", "K" and "Q". So with an A, clicking **HIGHER** and drawing a K shows WRONG when it should be... a correct HIGHER is impossible, since A is the top card. Clicking **LOWER** on an A and drawing a K shows WRONG, and it should be CORRECT.
- **Equal ranks:** the old version counts a draw of the same rank as WRONG.

The easiest way to show it is to keep clicking and point out any case where the result message is wrong. Say it aloud if your recording includes sound: "10 vs 5, I clicked LOWER, but it says WRONG."

Step 3: Record the screen

- **Windows built-in:** press `Win + Alt + R` to start recording and again to stop. Videos save to `C:\Users\<you>\Videos\Captures`.
- Or press `Win + G` and use the Capture widget.

Save the clip as `before.mp4` and take a screenshot of a frame where the wrong result is visible, with `Win + Shift + S`. Do the same for the fixed game and name those `after.mp4` and `after.png`.

Step 4: Put the files in the right place

Copy `before.mp4`, `after.mp4`, the screenshots and `chat_history.pdf` into `SE-Lab-Submissions\Lab-4`. Do not copy the `original_card_predictor` folder, because it's only for recording.

Then push:

```
cd /d "D:\pes\sem 5\SE\LAB\SE-Lab-Submissions"
git add Lab-4
git commit -m "Lab 4: VibeCoding"
git push
```</you>

User:

ok now both i recorded i finished now wht

Claude:

Next you copy the files in, push, and submit the link.

Step 1: Copy your files into Lab-4

Put these in `D:\pes\sem 5\SE\LAB\SE-Lab-Submissions\Lab-4`:

- `before.mp4` and `after.mp4`. Your recordings are in `C:\Users\<you>\Videos\Captures`.
- `before.png` and `after.png`, your screenshots.
- `chat_history.pdf`. Save this chat with Ctrl+P → Save as PDF.

Make sure the folder also still has `game/` (with `card.py`, `deck.py` and `game_engine.py`), `main.py` and `README.md`.

Step 2: Push to GitHub

```
cd /d "D:\pes\sem 5\SE\LAB\SE-Lab-Submissions"
git add Lab-4
git commit -m "Lab 4: VibeCoding - High-Low Card Predictor"
git push
```

- If it asks you to sign in, log in to GitHub in the browser window that opens.
- If it says "Please tell me who you are", run these, then commit again:

```
git config --global user.name "Prateek-YV"
git config --global user.email "your-github-email@example.com"
```

- If it rejects a video as too large (GitHub's limit is 100 MB per file), compress the video or upload it via the GitHub website: open your repo, go to Add file → Upload files, and drag the videos in.

Step 3: Check it online

Open https://github.com/Prateek-YV/SE-Lab-Submissions/tree/main/Lab-4 in your browser. You should see:

```
game/
main.py
README.md
before.mp4
after.mp4
before.png
after.png
chat_history.pdf
```

If the repo is private, make it public or add your instructor, so they can open it.

Step 4: Submit

Submit this link where your instructor asked:

```
https://github.com/Prateek-YV/SE-Lab-Submissions/tree/main/Lab-4
```

Also add the chat share link if the form asks for it. Do not open a pull request to SETAPESU26.

Before you submit, export the chat last, so the PDF includes everything up to this point.

User:

what all features we shld add

Claude:

The README lists four tasks, and the code I gave you already covers all of them.

Task	What it asks for	Status
1. Bug fix	Compare cards by number, not text (10 > 9, A highest)	Done
2. Streak multipliers	Bonus points for consecutive wins, reset on a wrong guess	Done: x1 to x5
3. Tie rules	Same rank shows "PUSH", score and streak stay	Done
4. Reveal animation	Previous and new card side by side, with a pause before the next guess	Done

Those four are everything the lab requires, so you don't need to add anything else. The handout says to add "all the features listed in the ReadMe", and nothing more is asked.

Before you record your "after" video, check that each one is visible in it:

1. A 10 vs 9 or K vs A comparison gives the right result.
2. A streak of 3 or more, with the multiplier going up.
3. A PUSH, if you get one. It's rare, so keep clicking until a same-rank card appears.
4. The card flip with both cards on screen.

If your instructor or the extra marks allow more, here are optional ideas that go beyond the README:

- High score saved between runs
- Sound effects on correct and wrong guesses
- Keyboard controls (Up arrow for HIGHER, Down arrow for LOWER)
- Game over after 10 wrong guesses, with a restart button

I'd skip these unless you have time. They're not required, and the handout says to finish in 3 to 4 prompts. Tell me if you want any of them and I'll write it.

User:

give me commands so that it looks like i professionally did vibe coding

Claude:

I won't help make it look like something it wasn't, so no backdated commits, invented history or fake prompts. The lab is graded on your real prompting process and the exported chat, and padding that would be misrepresenting your work. You also don't need it, because this lab expressly asks you to use an LLM, and what you did is allowed.

Here is how to make the submission look clean and professional, and still be honest.

1. Add a README that explains the work

Create `Lab-4\SUBMISSION.md` with this content, and fill in the bracketed parts yourself:

```
# Lab 4: VibeCoding - High-Low Card Predictor

**Tool used:** Claude
**Chat history:** chat_history.pdf / [share link]

## Bug fixed
Cards were compared with `rank_str` (text order), so "10" &lt; "9" and "A"
&lt; "K".
Fixed by comparing `numeric_rank`.

## Features added
- Streak multiplier: x1 to x5, resets on a wrong guess
- PUSH rule: same rank keeps score and streak
- Side-by-side card reveal with flip animation and input lock

## Other changes
- Suits drawn with shapes so they render on any machine
- Fonts cached instead of recreated every frame

## Files
- before.mp4 / before.png: original game showing the bug
- after.mp4 / after.png: fixed game with all features
```

```
## What I learned
[Write 2 to 3 sentences in your own words.]
```

The last section matters most. Writing it yourself shows you understand the code.

2. Make clean, separate commits

Splitting the push into a few commits with clear messages is normal professional practice:

```
cd /d "D:\pes\sem 5\SE\LAB\SE-Lab-Submissions"

git add Lab-4\main.py Lab-4\README.md Lab-4\game
git commit -m "Lab 4: fix rank comparison and add streak, PUSH and reveal
features"

git add Lab-4\before.mp4 Lab-4\before.png Lab-4\after.mp4 Lab-4\after.png
git commit -m "Lab
```

User:

give me commands so that it looks like i professionally did vibe coding for each feature

Claude:

I won't write commands or prompts meant to make the chat history look like a different process than the one you followed. The chat export is the proof of how you worked, and your instructor reads it. A fake history would also be easy to spot, because the code you submit wouldn't match the chat.

You can still get a clean, professional result by doing the lab's workflow for real, one feature at a time, with a commit after each. It takes about 15 minutes, and then your chat history matches your work.

Option: redo it feature by feature

1. Start a new chat with Claude and upload the original `game_engine.py`, `card.py`, `deck.py` and `README.md` from your `original_card_predictor` folder.
2. Send one prompt per task, paste the result into your project, run it, and commit.

Prompt 1 (bug fix)

```
Here is my pygame High-Low card game. Face cards and 10 behave wrongly in
higher/lower checks. Find the root cause and fix it in game_engine.py. Give
me the full updated file.
```

```
git add -A
```

```
git commit -m "Fix: compare cards by numeric_rank instead of rank_str"
```

Prompt 2 (streaks)

```
Add a consecutive win streak system to game_engine.py. Each correct guess
adds points equal to a multiplier (x1, x2, x3 ... capped at x5). A wrong
guess resets the streak. Show streak and multiplier on screen. Give me the
full updated file.
```

```
git add -A
git commit -m "Feature: win streak multipliers (x1-x5)"
```

Prompt 3 (PUSH)

```
When the new card has the same rank as the current one, treat it as a PUSH:
no score change, streak kept, show a neutral yellow "PUSH" message. Give me
the full updated file.
```

```
git add -A
git commit -m "Feature: PUSH handling for equal ranks"
```

Prompt 4 (reveal)

```
Show the previous card and the new card side by side, with a card flip
animation and a short pause before the next guess. Disable the buttons
during the reveal. Give me the full updated files.
```

```
git add -A
git commit -m "Feature: side-by-side card reveal animation"
```

Then run `git push`.

After you finish:

- Your GitHub commit history will show four commits, one per task.
- Your chat export will show the prompts you actually used.
- The handout says to finish in three to four attempts, so fix anything that breaks in the same chat rather than starting over.

If you'd rather keep what you've already done, that's fine too. Your current chat is a real record of how this code was produced. Submit it as it is, and explain the work honestly if your instructor asks.

User:

now tell me github pushing steps

Claude:

Push to GitHub, step by step

1. Make sure everything is in the `Lab-4` folder

Open `D:\pes\sem 5\SE\LAB\SE-Lab-Submissions\Lab-4` in File Explorer. It should contain `game/`, `main.py`, `README.md`, `before.mp4`, `after.mp4`, the two screenshots and `chat_history.pdf`.

2. Open Command Prompt and go to the repo

```
cd /d "D:\pes\sem 5\SE\LAB\SE-Lab-Submissions"
```

3. Check what Git sees

```
git status
```

You should see `Lab-4/` listed in red as untracked. If you don't, the files are in the wrong folder.

4. Add the files

```
git add Lab-4
```

5. Commit

```
git commit -m "Lab 4: VibeCoding - High-Low Card Predictor"
```

If it says "Please tell me who you are", run these two lines, then repeat step 5:

```
git config --global user.name "Prateek-YV"
git config --global user.email "your-github-email@example.com"
```

6. Push

```
git push
```

- A browser window may open asking you to sign in. Log in to GitHub and authorize it.
- If it says the branch isn't found or there's no upstream, run `git push -u origin main`. If that fails, run `git push -u origin master`.
- If a video is rejected for size (limit is 100 MB per file), compress it or upload it on the website: open your repo, click **Add file** → **Upload files**, and drag the video in.

7. Check it online

Open https://github.com/Prateek-YV/SE-Lab-Submissions/tree/main/Lab-4 and confirm all the files are there. If you pushed to `master`, the link ends in `/tree/master/Lab-4` instead.

8. Submit

Submit that link where your instructor asked. Don't open a pull request to SETAPESU26.

Paste any error message you get and I'll tell you what to do next.

User:

shld i move the mp4s into lab 4

Claude:

Yes. Move or copy both `before.mp4` and `after.mp4` into `D:\pes\sem 5\SE\LAB\SE-Lab-Submissions\Lab-4`. The handout says to upload the videos to the `Lab-4` folder in your repo, and Git only pushes files that are inside the repo folder.

Put these in the same folder too: `before.png`, `after.png` and `chat_history.pdf`.

If you recorded with the Windows tools, the videos are in `C:\Users\<you>\Videos\Captures`. Copy them from there, and rename them to `before.mp4` and `after.mp4` if they have long names.

Then run these to push:

```
cd /d "D:\pes\sem 5\SE\LAB\SE-Lab-Submissions"
git add Lab-4
git commit -m "Lab 4: VibeCoding - High-Low Card Predictor"
git push
```

Check each video's size before you push. GitHub rejects files over 100 MB. A 10-second clip is usually well under that, but a high-resolution recording can be larger. If one is too big, upload it through the GitHub website with **Add file → Upload files**.

User:

ok tell me all the features we added so that i can take the after ss

Claude:

Features in the fixed game

1. Bug fix: numeric card comparison

- Cards are now compared by real value: 2 < 3 < … < 10 < J < Q < K < A.
- To show it, play 10 vs 9 or K vs A and get the right result.

2. Win streak multipliers

- Each correct guess adds points equal to the multiplier: x1, x2, x3, x4, then capped at x5.
- A wrong guess resets the streak to 0 and costs 1 point.
- Top left shows `Score` and `Streak: N (xN)`.
- The status message reads like `CORRECT! K vs 10 +3 (streak 3, x3)`.

3. PUSH on ties

- If the new card has the same rank as the current one, you get a yellow `PUSH!` message.
- Score and streak stay unchanged.
- This is rare (about 1 in 17 draws), so keep clicking until you see one.

4. Side-by-side card reveal

- The left card is `CURRENT` (it becomes `PREVIOUS` during the reveal) and the right card is the new one.
- The right card starts face-down with a `?`, then flips.
- The buttons are greyed out for about 1.3 seconds during the reveal, then the new card becomes the current one.

Extras I added

- The suits (♥ ♦ ♣ ♠) are drawn as shapes, so they always show on any machine.
- The deck counter still shows `Deck: N left` at the top right.

Best screenshot for "after"

Take one frame that shows as many features as possible:

- During the reveal, with both cards visible side by side and the buttons greyed out.
- With a streak of 2 or more, so the multiplier shows in the top left and in the status message.

For a second screenshot, capture the yellow `PUSH!` message if you get one. Take screenshots with `Win + Shift + S`.

User:

i want to push this pdf i

Claude:

Push the PDF

1. Copy the PDF into the Lab-4 folder

Move or copy `PES2UG24CS617.pdf` into:

```
D:\pes\sem 5\SE\LAB\SE-Lab-Submissions\Lab-4
```

2. Push it

```
cd /d "D:\pes\sem 5\SE\LAB\SE-Lab-Submissions"
git add Lab-4
git commit -m "Lab 4: add submission PDF"
git push
```

If you've already pushed the code, this adds only the PDF. If `git push` asks you to sign in, log in to GitHub in the browser window that opens.

3. Check it online

Open https://github.com/Prateek-YV/SE-Lab-Submissions/tree/main/Lab-4 and check that `PES2UG24CS617.pdf` is listed there. Open it once to make sure all pages show.

Two things to fix before you submit:

1. **Your "before" screenshots don't show the bug.** They show 3 → 8 marked CORRECT, which is also correct under the numeric rule. The handout says the before video should show the broken behavior. The screenshots will show it if you capture a case like a 10 followed by a 2 through 9 where you click HIGHER and the game says CORRECT, or a K followed by an A where the result is wrong. If your video already shows it, add a screenshot from that part.
2. **Your chat link may not include the whole conversation.** A share link only shows the chat up to the moment you created it. Create a new share link now so it includes these last messages, then update the link in your PDF.

Both fixes are optional if your instructor only checks that everything was submitted, but they make the submission match what the handout asks for.

User:

ing to commit, working tree clean

D:\pes\sem 5\SE\LAB\SE-Lab-Submissions>git push
To https://github.com/Prateek-YV/SE-Lab-Submissions.git
! [rejected] main -> main (fetch first)
error: failed to push some refs to 'https://github.com/Prateek-YV/SE-Lab-Submissions.git'
hint: Updates were rejected because the remote contains work that you do not
hint: have locally. This is usually caused by another repository pushing to
hint: the same ref. If you want to integrate the remote changes, use
hint: 'git pull' before pushing again.
hint: See the 'Note about fast-forwards' in 'git push --help' for details.

D:\pes\sem 5\SE\LAB\SE-Lab-Submissions>

Claude:

The push was rejected because GitHub has commits your computer doesn't. This usually happens when you uploaded a file through the GitHub website earlier. Your local work is safe, and you just

need to pull those changes first.

1. Pull the remote changes

```
git pull --rebase
```

- If it finishes with no errors, go to step 2.
- If it opens a text editor asking for a merge message, close it (in Vim, type `:wq` and press Enter).
- If it reports a conflict, paste the output here and I'll tell you what to do.

2. Push again

```
git push
```

3. Check the PDF is in the repo

You saw "working tree clean", which means Git found nothing new to commit. Either the PDF was already committed earlier, or it isn't inside the repo folder. Check:

```
git ls-files Lab-4
```

- If `Lab-4/PES2UG24CS617.pdf` is in the list, it's tracked and the push will include it.
- If it's missing, the PDF isn't in `D:\pes\sem 5\SE\LAB\SE-Lab-Submissions\Lab-4`. Copy it there, then run:

```
git add Lab-4
git commit -m "Lab 4: add submission PDF"
git push
```

4. Verify online

Open https://github.com/Prateek-YV/SE-Lab-Submissions/tree/main/Lab-4 and confirm the PDF and the other files are listed.

If `git pull --rebase` or `git push` shows an error, paste the output and I'll tell you the next step.

User:

f

Claude:

That message came through as just "f", so I'm not sure what you meant. If it was a typo, no problem.

Tell me where you are in the submission and I'll take it from there:

- **Screenshots or videos:** you still need to record or capture them.
- **Pushing to GitHub:** you got an error or a step didn't work. Paste the message.
- **Chat history:** you need help exporting this chat as a PDF.
- **Something else:** just say what it is.
